

■ SQL Module 2 – Lab 1 Revision Notes

■ Interface Used: MySQL Workbench

Congratulations on completing Module 2, Lab 1! ■

You've now built a solid foundation in database creation and management using **MySQL Workbench**. Let's revise what you've learned in a fun and simple way ■

■■ **CREATE DATABASE** – Make your own database to store and organize data.

■ **CREATE TABLE** – Build tables inside your database to hold related data.

•■ **INSERT INTO** – Add new rows (records) into your table.

■ **ALTER TABLE** – Add, remove, rename, or modify columns in your table.

■ **TRUNCATE TABLE** – Erase all data from a table but keep the structure.

■ **DROP TABLE** – Completely delete a table and its data forever (be careful!).

■ **Quick Tip:** Always double-check your **DROP** and **TRUNCATE** commands — once executed, data cannot be recovered!

Keep practicing in MySQL Workbench and you'll soon master database design and manipulation! ■
