

■ SQL Module 2 - Lab 2: Fun Revision Notes

■ What You Learned in This Lab:

- 1 ■ Use MySQL Workbench (instead of phpMyAdmin) to operate on MySQL servers.
- 2 ■■ Create a brand new database using the MySQL Workbench interface.
- 3 ■ Design and create tables for your dataset using SQL scripts.
- 4 ■ Load data directly from a CSV file into your MySQL table — fast and efficient!

■ Advantages of This Lab:

- 1 Boosts your hands-on skills with MySQL Workbench — a professional tool used in the industry.
- 2 Makes database creation and management much easier through its user-friendly interface.
- 3 Saves time by allowing CSV data imports directly into tables — no manual typing needed!
- 4 Teaches real-world data handling — essential for data analysis and data science projects.

■■ Disadvantages (Keep in Mind!):

- 1 MySQL Workbench can be a bit heavy on low-end systems.
- 2 Large CSV imports might cause temporary lag or connection timeout.
- 3 It's easy to make mistakes in SQL scripts if syntax is not double-checked.
- 4 You must ensure the CSV structure matches the table schema to avoid import errors.

■ Great job mastering MySQL Workbench basics!
You're now one step closer to becoming a data pro! ■
