

■ SQL Revision Notes: WHERE vs HAVING

The **WHERE** and **HAVING** clauses in SQL are both used to filter records, but they serve different purposes. Here's a fun and easy comparison to help you remember them! ■

Feature	WHERE Clause	HAVING Clause
■ Purpose	Filters rows before grouping	Filters groups after grouping
■ Used With	SELECT, UPDATE, DELETE	SELECT (with GROUP BY)
■ Works On	Individual rows	Aggregate functions (like COUNT, AVG)
■ Aggregate Functions	Cannot use aggregate functions directly	Can use aggregate functions
■ Order of Execution	Applied before GROUP BY	Applied after GROUP BY
■ Example	SELECT * FROM Employees WHERE Salary > 50000 SELECT Department, COUNT(*) FROM Employees GROUP BY Department HAVING COUNT(*) > 5	

■ Quick Recap:

WHERE → Filters data **before** grouping. (Used for rows) **HAVING** → Filters data **after** grouping. (Used for groups)

Example:

-- Using WHERE

SELECT * FROM Students WHERE Marks > 80;

-- Using HAVING

SELECT Class, AVG(Marks) FROM Students GROUP BY Class HAVING AVG(Marks) > 85;
